Synthesizer with 4 waveforms, 4 filters, 4 reverb and 4 delay. Up to 127 oscillators can be selected for the modulation of the filter: this allows a huge palette of synthesis, with all of them achieving a particular timbre that can be changed at any moment. Various "Portamento" and "Pitch" effects that can be used to control the style of the analog synthesis. If you don't like to use the MIDI, Analog Nexus can be connected to your USB cable to sync the parameters of modulation, filter and reverb with the effect of the Analog Nexus. 6 CR-synchronized effects that will recall the real music in an incredibly synthetic way. 64 presets provided. The first 32 presets can be used when you connect the device using the supplied key. There is an option to memorize the next 32 different presets. You can press the Menu button and select a speaker to hear how the presets sound. A detune effect that allows you to generate new sounds by detuning the oscillators. Dual oscillators can be used to increase the synthetic variety, since they can work in combination for octaves. 8 MIDI channels Mixing and filtering using 8 audio inputs Use the panning function to create stereo/polyphonic/monophonic effects Input level of the total output Output level of the output level (for use with speakers) Output level of the level (for use with the headphones) Mixing and filtering using 4 audio inputs Mixing and filtering using the rear panel of the unit Mixing and filtering using the headphone amplifier Channel mute (for use with headphones) Channel invert (for use with speakers) Volume management (reducing all audio levels simultaneously) Control of volume, the gain of the oscillators, filters and outputs can be automated by MIDI, sound or CV-input signals Synthesizing audio from the USB audio input Gate method with limit, buttons and changing scale for audio Linear method with in-level Multi-color LED All parameters can be saved to the programmable keys Stereo audio outputs MIDI clock divisions of 64 (intervals of 16th note) (64/64/128/256/512) MIDI clock divisions of 8 (intervals of 2/2/3/4/4/4/8/8/16) MIDI clock divisions of 4 (inter

A: For the most part you are correct that the number of 'true' analog modules is sparse. By this I mean that you are correct that in a traditional modular format, you can't get a true analog sound from a computer, and in the case of software synthesis, you are correct that a real analog module can't just generate a sound on its own. However, you can get a
