Xref format Like most applications that operate with the DXF file format, AutoCAD supports the ability to transform the original drawing to another format, from standard (DXF) to AutoCAD specific (xref). This feature can be used to create cross-reference tables, lists of sections or subsets of the drawing. These xrefs are created by the user or generated by scripts. The xref created by the user can be maintained after the file is saved, where a script generates a xref file automatically when a drawing is saved. These xrefs are often used when updating or updating parts of the drawing, often in connection with the cross-reference table (creating a table cross-referencing the main drawing with the xref). The xref can be read in DXF and other formats. In some products a "double-click" or "mouse-over" action can be used to show a preview of the xref. Autodesk Labs added a new functionality for 2016 called Reverse Xref: the possibility to edit xref directly from the drawing in a smart way. Architecture and modeling These functions are included in the various CAD software available on the market. However, most of them are only available in AutoCAD. The selection of the functions is different depending on the sub-model. # Fireproofing In the following image, all the fireproofing components are shown as separate entities. 1. Select all the faces that are part of the fireproofing system. 2. Right-click and choose Fireproofing > Set Fireproofing. 3. \* The Fireproofing component should be applied to all faces. All the faces that are not part of the fireproofing should not be shown on the drawing. \* Right-click and choose Finishing > Set Finish. \* Right-click and choose Leveling > Set Level.

### What's New In AutoCAD?

Incorporate changes in other drawings more easily and quickly. When the CAD Drafting Assistant notices a pending change in a drawing while annotating other drawings, it can mark up the other drawings. Change the data in one drawing and the others update without you having to make any changes. (video: 2:00 min.) Drawing templates make it easier to get started right out of the box. Drawing templates allow you to configure and save your own, pre-made drawings. Templates are displayed as icons in the toolbox, and you can easily create new templates by dragging them there. (video: 1:00 min.) If a template is not the right tool for your design, you can configure an existing drawing to work as a blueprint by dragging and dropping onto the blueprint. You can use the blueprint as a template to quickly create your own drawing, or even to make a custom drawing and export it as a DWG. (video: 2:00 min.) Support for more drawing templates. New templates include architectural, floor plan, and more. You can quickly configure a set of standard templates from the template manager and save them in a drawing template folder. (video: 1:45 min.) With the new Create Blueprint Drawing feature, you can quickly create and publish a custom blueprint drawing from an existing template. With a special drawing template, you can create a custom drawing of a floor plan, a building model, or any other drawing that's not a regular blueprint. You can even make changes to an existing drawing and export it as a blueprint. You can create the drawing by dragging and dropping an existing drawing template into the blueprint. (video: 1:35 min.) You can now edit or share annotations in other drawings while annotating a drawing. Annotations can be locked to prevent any changes while drawing, allowing you to focus on the drawing task. (video: 2:45 min.) When you insert a drawing in another drawing, you can associate the drawing with specific Annotations. This gives you the option to delete the annotation at a later date. (video: 1:00 min.) Better browsing and searching. Improved browsing and searching results in a single

place. Now, you can quickly navigate through your drawing folder to find what you need. Searches are also more powerful. You can search by drawing properties, such as annotations or whether a drawing has been opened. (video: 1:00 min.)
