Hosaka TN3270 is an excellent Windows Terminal emulation program that allows you to display a hard copy of a computer screen on a 3270 terminal. You can connect to an IBM mainframe just the way you would with a regular 3270 terminal emulator but the 3270Hosaka is faster, smaller, easier to use and supports color. You can also connect to an OS/390 system through a SNA or TCP/IP connection. It is compatible with Windows XP and 2000 and a few older releases of Windows. The application displays the upper left-hand side of a typical virtual frame buffer and you need to define the upper right-hand side. To do this you need to use the virtual frame buffer's character set setting. You can use a GOSKOCR(.CK) or an IBM GOSKOCR(.GOSK) which display special characters and ANSI control characters, or you can use a GVPS(.UCS) or GVPS(.GVP) which display only the standard characters. Default displays are available for ANSI controls, graphic characters and for the IBM GOSKOCR(.CK) and IBM GOSKOCR(.GOSK). You also need to supply the pixel width and height of the virtual frame buffer. The defaults are typically 32 pixels high and 24 pixels wide but if you have a larger screen you can change them.
