This study was designed to investigate the effect of a physical disability (cerebral palsy) on the material self-concept of a mother. A group of 90 mothers whose children had cerebral palsy was compared with a non-disabled group of 90 mothers. The mothers' material self-concept, caregiving values and societal role expectations for their disabled child, and their desire for a normal family situation were assessed. No overall differences were found between the groups on the material self-concept, caregiving values or societal role expectations for their disabled children. Mothers in the cerebral palsy group, however, tended to have a more positive self-image of their own mothers and fathers. No overall differences were found on the mother's or father's own desire for a normal family situation. The study results are discussed in terms of the effects of physical disability on the material self-concept of disabled people and the use of this concept in the study of the family environment of disabled individuals.Q:
