Q: What is the proper use of a repository? Although I understand what a repository is intended to be used for, I don't know what I'm doing wrong when I'm using it. Usually when I'm pushing a change to origin, it gives me this: fatal: The remote end hung up unexpectedly I assume that means I have a bad repository in my local branch. So, when a client says, "Hey, check out this repository" what do I do? Do I just make a new branch? What is the proper workflow?

This is all for MVC3 and Visual Studio 2010. A: I don't know where you put your repository, but you must have a remote server hosting the repository. A remote repository allows a client (I assume the "client" is a web-server) to clone (pull) the repository to its own directory. You probably have a repo in your projects solution, and when you do a git push, it pushes to your remote server. Now, if you have a local repository, you can go to source control > repository type > add a new repository. This is essentially the same as a remote repository, but it will only be a local clone. This is

normally intended as an interactive or some kind of "test" repository. As for the failure you're getting, it could be any number of things, depending on your error.

2. Description of Related Art
As a material for the part molded by a press-form, a so-called composite metal material is used in which plural kinds of metal materials are laminated one on the other. There are reasons that a steel sheet excellent in forming workability and excellent

For example, Japanese Patent Laid-Open No. 201358/1987 discloses a method of producing a laminate by bonding a steel sheet and a synthetic resin sheet excellent in forming workability and the synthetic resin sheet being excellent in appearance. Japanese Patent Laid-Open No. 201358/1987 describes that the steel sheet includes a steel sheet having a structure with a residual austenite and a value Q (mm^2/g) in the steel sheet being
