Sensory evaluation of six fresh, 55% DM corn silages (four bromegrass [BrG] and two alfalfa [AF] silages) fed to lactating Holstein cows indicated that all were palatable. Acid detergent lignin and cellulose concentrations were higher in the BrG silages than in the AF silages. NDF, ADF, and hemicellulose concentrations were lower in the BrG silages than in the AF silages. Starch content of the silages was similar. The concentrations of soluble sugars were greater and concentrations of water-soluble carbohydrates were lower in the BrG silages than in the AF silages. Concentrations of total neutral detergent fiber and acid detergent fiber in the BrG silages were greater than in the AF silages. Ammonia concentrations were greatest in the AF silages. Lactating cows fed BrG silage diets had higher ADG and lower DM intake than did cows fed the AF silages. NDF digestibility was greater in cows fed the BrG silages than in cows fed the AF silages. Digestibilities of neutral detergent fiber and acid detergent fiber were not different. Estimates of total tract digestibilities of NDF and ADF were greater in cows fed the BrG silages than in cows fed the AF silages. Digestibilities of crude protein and acid detergent lignin were not different. Estimates of soluble-nutrient digestibilities were not different. These data indicate that incorporation of BrG into fresh forages can improve the nutritive value of diets fed to lactating dairy cows.Researchers at the University of Queensland have taken an innovative approach to improving the performance of solar cells. With conventional solar cells, the main problem is the energy loss of light that occurs before it reaches the solar cell. UQ's researcher Dr Brian Cox is looking at creating quantum dot solar cells. "They look like a normal solar cell except they've got nanoparticles all around it that absorb light before it gets to the silicon layer," he said. "This allows more light to be absorbed and the silicon layer to convert it into electricity." The majority of
