Childhood-onset epilepsy with or without myoclonic epilepsy in infancy: clinical features and genetic analysis. Childhood-onset epilepsy with or without myoclonic epilepsy in infancy (GMEI) is a relatively recently defined epileptic syndrome. It is usually characterized by atypical seizures, including tonic seizures, myoclonic jerks and atypical absences. Brain imaging reveals structural abnormalities, in particular microlissencephaly, polymicrogyria and increased subarachnoid spaces, which are not usually detectable in idiopathic absence epilepsy, but are often observed in temporal lobe epilepsy. However, recent observations have reported, in a few cases of childhood-onset epilepsy with or without GMEI, the coexistence of a temporal lobe structural abnormality and lack of either response to corticosteroids, or a genetic f30f4ceada
