The CS5 version of Adobe Photoshop is the newest iteration. This version includes new features such as Adobe's Kuler, which creates color palettes from designs found online. The program has added support for additional RAW and compressed image formats. It also offers a number of new-to-photoshop features, such as Photoshop Actions, a one-stop shop that organizes the application's various tools and features so you don't have to search for an application button to use a feature.

### Making Use of the Skeleton

You'll find that when you're looking at a photo that it includes some sort of skeleton. This means that, in some form, the photo shows a top-down view of the image, as well as its major structures. However, unlike a cartoon, where you don't need to create the skeleton, with photography, the skeleton, or framework, is necessary for the actual photo. Without it, you have no reference to what you're looking at, making it difficult to figure out how to make those changes that are necessary. To create your own skeleton, you must include a few separate layers:

- Skeleton:** This is the center layer of your skeleton. It contains both the main shadows and highlights of the image and the objects that are going to be the primary focus of your photo. In Figure 6-1, the skeleton is the primary focus of the image. In other words, most of the photo is created by using the shadows and highlights that are on this layer. In Figure 6-2, the layer is surrounded by other layers that allow you to adjust the main structure of the image.
- Background:** This layer should be as transparent as possible while still containing the main photo. It's the layer that you want to use when you want your photograph to be the focus of the photo. A light background with a dark foreground looks better than a dark background with a dark foreground. In Figure 6-3, the Background layer allows you to see the sky and the dark areas of the house. In Figure 6-4, I'm using the Transparency function in Photoshop to allow the gray to be visible on the Background layer, which results in a foreground that's too dark.
- Foreground:** This is the layer that enables you to select the foreground of the image. It's the image that you want to focus on in the final image. When you do a photo shoot or you edit an old photograph,
