From AutoCAD's inception in 1982, it was marketed as a desktop app that could be run on inexpensive desktop computers with internal graphics controllers. Unlike other CAD programs of the time, AutoCAD required no costly, special-purpose hardware to run. The software development team made its own custom chips for its input devices and memory board to support its highly detailed graphical user interface (GUI). The company also made its own "mouse" for its users. By the end of 1983, AutoCAD was bundled with machines sold by IBM. Within two years, it was the fastest-growing software company in history. Within three years, the company had more than 100 million users. AutoCAD is currently installed in more than 130 countries. As its name suggests, AutoCAD is used for creating architectural design drawings. In addition to its architectural design and drafting features, the program can also be used for most of the design work required to create mechanical, plumbing, and electrical design drawings. The following paragraphs outline the essential features of AutoCAD. AutoCAD is available as a client/server product, which means that the drawing is always rendered at the server and is then sent to the client. However, AutoCAD 2010 client and Server are integrated and can work on the same computer, with the only difference being that the server can be shared. The server functionality is offered as either the "Rendered" or "Printed" version of AutoCAD. The server can be installed as either a pre-release or as an upgrade from earlier versions of AutoCAD. For information on the server, see the corresponding section below. Automatic import of files from other applications is possible through the use of the import and export function. For this function to work, the drawing that is to be sent to AutoCAD must be in the DXF format, which can be imported into other applications.
