1.1 Design and Communication: Autodesk Engineering Digital Models consist of a set of Digital Models (DMs). A DM represents the geometry of an engineering design, such as a building or component. DMs are saved in a Digital Model Repository, which is a repository for each DM's .DWG, .DWF, .DBW, and .DRW file. Digital Models are organized in a hierarchical manner. DMs can be grouped together in Collections. A document can contain several DMs. 1.2 Conceptual Design: A DM is a collection of elements, such as dimensions, datums, surfaces, reference planes, and alignments. The document containing the DM, not the DM itself, is considered the parent document. DMs are a set of groups of elements. A group is a collection of elements that belongs together, such as a door and its frame, which together form a door assembly. DMs are made up of three kinds of elements: 1.3 Geometric and Editing: A DM contains geometry and editable attributes. Geometry contains a closed set of points, lines, and polygons that make up the shape of the component or building. There are two types of editable attributes: attributes that change the actual geometry of the component, and attributes that describe the component or building. A DM can be combined with other DMs to create larger components or buildings. 1.4 Functions: DMs are associated with functions. A function is a capability. For example, the opening function allows you to specify how the door opens. Functions are assigned to DMs when they are created. DMs are always associated with a specific function, such as opening or closing. 1.5 Modeling: A DM is organized into a tree of objects. The tree allows you to create large, complex DMs. Each object in the tree represents the shape of a component or building. Every object in the tree contains other objects. For example, the model of a door might contain a door frame and a door leaf. A DM is related to other DMs through a relationship that is established when DMs are created. A relationship is an association between two DMs. The parent DM, the DM being associated with the child DM, is called the donor DM. The child DM, the DM being associated with the donor DM, is called the receptor DM. 1

Open architectural software Open Architectural Software (OAS) is a term coined by Ron Lundeen for a family of open source architecture software including Vectorworks, BIMsketcher, XAPP, and Simply Sketch. It is currently based on the use of the Open Architecture Collaboration (OAC) format and is compatible with the OASIS 1.0 standard. These products allow model-based BIMs to be exported to other applications such as Revit and ArchiCAD, and from the CAD application in other workflows such as GIS. OAS is a fork of CAD Entity Services. OAC is also compatible with the 3D parametric modeling system ArchiCAD. In September 2008, Open Architectural Software and the Open Architecture Alliance (OAA) announced the creation of the Open Building Information Model (OpenBIM). OpenBIM is a new set of standards and specifications that are aimed at standardizing the exchange, exchange, and information access. Design for manufacture Design for manufacture (DFM) is a term that was coined by Process Solutions International and covers a wide range of technologies, including the use of AutoCAD Cracked Version and other CAD software, electronic designs, and others to build a product. The term is sometimes used by Autodesk to mean "design and build" although the work can be done by any of the various CAD systems. For example, a project that includes a drawing created in Inventor can be output to an electronic model for use in production. Design for manufacture is sometimes used to distinguish between engineering

design (which is the way most CAD systems normally operate) and the steps necessary to build a finished object, like production engineering. In other words, the DFM process is usually the way CAD is used to create drawings,

but other processes are needed to get the product out of CAD and into the field. Model-based applications

Autodesk has provided the following model-based products: ATE models: ATE models are file formats that represent Autodesk's Automotive Design Environment, Autodesk's Enterprise-level multi-platform automotive design environment that includes tools for working with data and product definition, including both 2D and 3D design, engineering, fabrication, and marketing. ATE models are supported by the Autodesk AutoCAD MEP and Autodesk Inventor software applications, and work with other AutoCAD applications to integrate data. EVA: EV

Open the Autocad file (\*.dwg) Save it as a.zip file (\*.zip) Extract the files Unzip the file and locate the 'Rulz.key' file. Place the file in your Autocad application directory. Open Autocad, do a "File > open" and navigate to where you placed the key. The file will open and you'll be prompted to "lock it down". Select "no" to unlock it. If you then press "C" the work area will be unlocked. Category:AutoCAD Category:Fracture mechanicsQ: How to get code line number on a text editor? I'm trying to implement ctrl+L in my text editor which I'm currently writing. I've been able to make it to work in Notepad++, in visual studio to show the position and line number of the cursor, and in my application I've been able to get the current line number. The problem is that in my application when I press ctrl+L (works fine in Notepad++ and visual studio) it is getting the line number of the next line and not of the current line, so it displays always the same number, instead of changing line number. I've been playing around with TextSelection and TextView (code below) but I can't seem to figure out a way to get the current line number. I've been looking around online for some kind of generic solution, but I can't find anything. private void getSelectedLines() { TextSelection selection = (TextSelection)GetType().GetProperty("TextSelection", BindingFlags.Static | BindingFlags.Public).GetValue(null, null); TextView textView = (TextView)GetType().GetProperty("TextView", BindingFlags.Static | BindingFlags.Public).GetValue(null, null); foreach (TextLine textLine in selection.GetTextLines()) { textView.Text = textLine.LineText; } } A: Apparently this is possible. When you call TextView.
