Highly efficient conversion of CO₂ and H₂O into formaldehyde and synthesis of layered zinc tin oxides for formaldehyde storage and fuel cells. Layered zinc-tin oxides (ZTOs) were synthesized by a simple coprecipitation method, and their application as formaldehyde (HCHO) sorbents was explored. According to XRD and BET measurements, the as-prepared ZTOs were found to be polyhedron-shaped particles with a layered structure. HCHO adsorption was enhanced with increasing H₂O and CO₂ pressure at 25 and 50 °C. Under the optimum reaction conditions, the maximum HCHO sorption capacity of ZTO was 267.2 mg g⁻¹ at 25 °C, 8.42 wt% at 50 °C, and 3.00 kPa at 150 °C. Equilibrium HCHO isotherms were described well by a single-site Langmuir isotherm, in which the HCHO adsorption on ZTO involved two steps: one was an initial intraparticle diffusion step and the other was

This invention relates to a weighing system which is useable by a vehicle driver, and has particular application to a scale used in connection with a vehicle's instrument panel. In practice the term "vehicle" is used to include all land, air, sea and space vehicles and is also understood to include vehicle "equipment" such as batteries, switch packs and the like where the vehicle is not self-sufficient. The term "vehicle" as used herein is not restricted to any one type of vehicle or its application but will include all suitable vehicles where appropriate. In the field of vehicle weighing it is known to measure the weight of a vehicle by use of a digital weighing unit comprising either one or two weighing cells. Typically, the digital weighing unit will measure the weight of the vehicle at an interval which is sufficient to give an accurate result in connection with the vehicle's performance data. This data is then displayed on the vehicle's instrument panel. Current vehicle weighing units typically operate in two modes. In the first mode the user of the vehicle can select either a "dry" or "wet" operation. During the "dry" operation the vehicle weight is measured when the engine is cold and there is no fluid in the vehicle's fuel system. The engine is then run for a few minutes to warm it up. During the "wet" operation the vehicle weight is measured when the engine is running and a fluid such as petrol, diesel or bio fuel is in the vehicle's fuel system. In order to reduce the overall cost of vehicle construction and hence increase its market value, vehicle manufacturers need to reduce weight and there have been many recent attempts to replace more expensive materials with cheaper and less demanding materials which are more readily available. One way in which vehicle weight can be reduced is by use of electrical equipment. In particular it is known to use a microprocessor based control unit to control the operation of electrical components in a vehicle. It is also known to incorporate
