Wiley Dreamtech Publication..Q: What's the easiest way to split elements in a string using XSLT? I'm looking to create a template to split the characters of a given string and return the individual split elements as result. Hello world! For example: if the input is "Hello world!" then I would expect the result to be "Hello" and "world!" but instead the result is "Hello". What I want is for the input to be split based on what's inside the parenthesis, so in this case

it should be "Hello", "w", "o", "r", "l", "d!". What am I doing wrong here? A: In XSLT 3.0, you can achieve this with the new strtoken function. For example: XML Input Hello world! XSLT 3.0 Hello 595f342e71
