Over the years, though, it's become increasingly clear that many of the techniques the young ad guys are taught now are simply not that effective. Why do so many advertisers, some of them pretty smart and sophisticated folks, continue to pay for ads that people generally don't even click on? I have a theory. This is it: Ad guys and women are simply not as sophisticated as they think they are. Just take a look at the ads. I've come to call the single-page, single-spaced comic strip ads "my bread and butter," a/k/a the kinds of commercials I designed in the early 1970s when I was a comedy writer for Advertising Age. They're the stuff the ads guys still so adamantly believe in, like TV/radio spots and on-site display ads. When I first started out, I realized that much of my writing wouldn't be read by the man in the street, much less by anyone on the ad side. So I bff6bb2d33

Short- and long-term variations in the inflammatory response induced by glucocorticoids in normal human lymphocytes. We have investigated the effects of glucocorticoids on inflammatory responses in normal human cells. Lymphocytes were incubated in the presence of 1.0 or 10^{-8} M prednisolone in order to monitor the modifying effects of the drug on the expression of activation-related and differentiation-specific antigens. Glucocorticoids caused only slight and transient changes in the respective cell surface markers. However, glucocorticoids modulated several cellular functions, especially those related to antigen-induced responses. Thus, suppressive effects of prednisolone on the proliferative responses of cells to the antigens tested were detected, as well as an increased release of IL-2 induced by the mitogen Concanavalin A. The possible significance of this effect of glucocorticoids is discussed.

Highly Polarized-Type Electron and Hole Transport Layer Containing the Triphenylene-Based Viologen at the Perovskite/Organic Solar Cell Interface Layer. A novel highly polarized-type electron- and hole-transport layer was designed using the triphenylene-based viologen. The counter anions of the oligo(phenylene ethynylene) derivative, 7,7-(3,6-bis(diphenylamino)-9H-carbazol-9-yl)-3,3',5,5'-tetramethyl-9,9'-spirobi[7H-isobenzofuranmethane] (CV101-NMe₂), was replaced by alkali metal ions to make changes in the distance between the hole- and electron-transport layers. The thickness of the CV101-NMe₂ single layer in its solid state was measured to be 23.3 nm, and the thickness was thick enough to obtain polarization as the interfacial layer at the perovskite/organic solar cell interface. Circular dichroism experiments clearly demonstrated that this layer was the π -conjugated type rather than the π - π^* -type. The hole- and electron-transport layers with electron-donating or electron-accepting properties were created by the same method. The utilization efficiency of

In the event of bacteraemia or meningitis it can lead to rapid sepsis and death. In this study, we performed a comparative transcriptional analysis of the response of MenB and MenC strains to different conditions of growth. Our results demonstrate that the MenB and MenC response to growth differ in certain aspects. When compared to the MenB strain, the MenC strain exhibited an increased capacity to adapt to the standard growth conditions. This suggests that MenC is better able to survive to environmental changes imposed by the host immune system. Therefore, MenC may be able to infect the host for longer periods of time and more effectively evade eradication by the host immune system, leading to the development of invasive disease in the host. The main differences in the response of the MenB and MenC strains were detected in the non-classical virulence factors regulon. The activation of the capsule, OpuAC and OpuA genes was found to occur early in infection. This observation raises the possibility of using these genes as targets for therapy. Our results also demonstrated the existence of a positive regulation between the TTSS2 and the regulation of capsule expression. The transcript levels of TTSS2 increased in capsule-negative strains in the exponential and stationary phases of growth. These results are consistent with the role of the TTSS2 in invasion, which would involve a capsule-independent mechanism. The transcriptional regulation of capsule expression by the TTSS2 may therefore be used as a means of regulation, in addition to those described above. In order to analyze the virulence of MenB and MenC strains as a function of time, a well-established macrophage model (HBMEC/B3-PBEC) was used. Using this model, we were able to demonstrate that MenB strains have an early inflammatory response, characterized by the induction of TNF- α . This observation suggests that the early release of this cytokine in the infected host might aid in the dissemination of the bacteria. On the other hand, MenC strains appear to induce an up-regulation of IL-1 β and MMP-9 at later stages of the infection. In contrast,
