## MP3 Tag Renamer

- Organize large MP3 music collections quickly and conveniently. - Find and delete duplicates. - Find and rename files, edit ID3 information. - Create playlists. - Split and merge music tracks. - Rename files using regular expressions. - Convert MP3 files to other formats. - Clean your hard drive. - Compatible with Windows XP, Vista and Windows 7.

Embodiments of the invention relate generally to battery charging circuits and more particularly to a direct current-based over-current protection circuit for a battery charger. Battery charging circuits typically convert alternating current (AC) power to direct current (DC) power to supply power to a battery from an alternating current power source. The DC power is converted to alternating current power to provide a charging current to the battery. When the battery is fully charged, the direct current-based over-current protection circuit is turned off to ensure safety. The power supply power is disconnected and the battery is removed from the battery charger. In some applications, such as developing the battery charging circuit, the removal of the battery can have adverse effects on the development and testing of the charging circuit. Accordingly, there is a need for a battery charging circuit that overcomes these and other problems with existing methods.

From DE 38 11 814 A1, which is incorporated by reference, a roof panel is known in the form of a covering for a motor vehicle. The roof panel can be situated at least partially in the vicinity of a passenger space of the motor vehicle. In the case of this known roof panel, the roof panel has a through-opening that extends from the passenger space into the roof panel. To this end, the roof panel has a frame that is situated at least partially inside the roof panel. The frame has a longitudinal projection, which, in conjunction with at least one holding structure connected to the passenger compartment, makes it possible to connect the roof panel to the passenger compartment. Furthermore, the roof panel has a bearing bracket, which makes it possible to connect the roof panel to further functional components, for example a radio enclosure. The holding structure may be constituted by a transverse extension of a vertical strut, which extends between the frame and the bearing bracket.

A successful quilt auction in Connecticut was met with much enthusiasm. “It was all about the quilts, the quilts and more quilts. You could tell that the attention to detail was brought to this and we wanted this to be special,💎

**Field of the Invention** The present invention generally relates to a sealing structure of a housing assembly for a hermetic cooling unit used for a liquid crystal display or the like, and more particularly, to a sealing structure of a housing assembly for a hermetic cooling unit, which has an improved strength through a deformation preventing process such that a surface of a cooling medium supply port is deformed to increase a contact area between the surface and a valve housing. The present invention also relates to a method of manufacturing the housing assembly for a hermetic cooling unit, which prevents a deformation of the surface of the cooling medium supply port.

**2. Background of the Invention** In general, a liquid crystal display (LCD) has a flat screen shape and is used as a means for displaying electronic information. The LCD is widely used for portable computers, monitor displays for office equipment, public information displays, televisions and others. The LCD controls the light transmission of a liquid crystal layer by applying an electric field to liquid crystal molecules of the liquid crystal layer in order to display an image. The LCD requires a low voltage operation because of its weak power consumption as a power consumption in a light bulb is about 20-25 W and, requires a high contrast performance because of characteristics of the liquid crystal such as a light and a dark are reversed when being in a voltage state. In order to realize such a low voltage operation and high contrast performance, the LCD is equipped with a cooling unit having a low temperature, which contains a hermetic cooling unit. The cooling unit may be categorized into a liquid cooling and a vapor cooling. In particular, the liquid cooling is used for a portable display apparatus, which includes a container for containing a cooling fluid. This container typically includes a liquid supply port through which a cooling fluid passes, a valve housing for restricting a flow of the cooling fluid, a cooling medium supply port for supplying the cooling fluid introduced through the liquid supply port to the inside of the valve housing, and a lead for returning the cooling
