Elden Ring Features Key:

Transformations of Methimazole into Isomeric Thioureas by Simple Hydrolysis and Chemical Hydrolysis. Hyphae of the agaric mushroom *Agaricus bisporus* are able to catalyze the hydrolysis of methimazole (MeIM) to the thiourea, isomeric to the recognized inhibitory substance mepazine. The reaction is catalyzed by the enzyme side-chain hydrolytic activity. This work demonstrates that a more expeditious, rapid, and simple hydrolysis of MeIM to isomeric thioureas is always possible by slow hydrolysis. The hydrolytic group appears to be the hydroxyl group of MeIM, which is hydrated to form a thiazoline dione (a thiourea), to be distinguished by the color of the reaction medium where the final hydrolysis has been observed. The final hydrolysis is often catalyzed by the addition of a thiourea. The thiourea formed does not leave the system and may remain as a side product even under basic reaction conditions where the thiourea should leave.
