The present invention relates to a technology of individually pressing a connection terminal to be connected to a terminal of an electric wire (hereinafter simply referred to as wire) with a terminal pressing member using a shaft which is rotatably provided in the terminal pressing member and can be inserted into the connection terminal. Heretofore, there has been proposed such a terminal pressing member as described in, for example, Japanese Patent Laid-Open No. 8-188292. This terminal pressing member has a rectangular frame body, and a pair of first shafts each having a tapered head at one end thereof are respectively engaged in such a manner as to allow each first shaft to be rotatable with respect to the frame body. Each first shaft is bent at an intermediate portion thereof. A flat terminal pressing plate formed of a synthetic resin plate is mounted on the frame body. The terminal pressing plate is bent in conformity with the bent portions of the first shafts. One end of a leaf spring which is fixed to the terminal pressing plate is put on a raised portion which is formed in the flat terminal pressing plate, while the other end is put on a rectangularly-shaped portion which is formed in the frame body. The leaf spring is arranged in such a manner that its one end is put on the raised portion in accordance with the rotation of the first shafts in one direction and its other end is put on the rectangularly-shaped portion in accordance with the rotation of the first shafts in the opposite direction. In the terminal pressing member constructed as described above, by pushing the terminal to be connected into a gap between the terminal pressing plate and the frame body through the terminal pressing plate, the terminal is pressed by the terminal pressing plate to deform the terminal. Further, by inserting a second shaft formed with a wire-pressing blade into the terminal, the connection terminal is prevented from being pushed in the radial direction of the shaft in the terminal pressing member. However, in the conventional terminal pressing member, the one end of the leaf spring is put on the raised portion which is formed in the flat terminal pressing plate, while the other end thereof is put on the rectangularly-shaped portion which is formed in the frame body. Therefore, in order to reduce the size of the terminal pressing member, it is necessary to bend the flat terminal pressing plate at a large angle in conformity with the raised portion in the flat terminal pressing plate, and to bend the frame body at a large angle in conformity with the shape of the rectangularly

Q: How to have a dropdown box inside the form_tag I am using a simple Rails app to handle signup for my site. For this I used the Devise gem for authentication. I did create the controllers for my site before using the Devise gem. I am trying to make a simple dropdown box to be able to select certain values from it. I am still a beginner when it comes to coding and I am trying to figure out how to do this. I have the simple html part with a dropdown where the user can select certain options from but I do not know how I can get that information into the form_tag part of the app. I know that this is a basic question but I am a novice programmer and I do not know where to look for this answer. I would greatly appreciate any help. Here is the code I have right now:

```
"post" do %>
```
