I've been using this syntax for updates: Dim cmd As New OleDbCommand(UpdateQuery, conn) Dim rows as Integer = cmd.ExecuteNonQuery() I know this is just a portion of the statement. Does anybody have any other options that I can try? I would like to find a way that is as efficient as possible. A: Yes, but it's a bit more involved. Firstly, you need to create a connection to the database. As a side note, create the connection in your main form first instead of in the code: MyDB = New OleDbConnection("My connection string here") MyDB.Open() Then, you need to get the command object and execute the command (updating all or none at a time) like so: Dim cmd As New OleDbCommand() cmd.CommandText = UpdateQuery cmd.Connection = MyDB cmd.CommandType = CommandType.Text For Each myRow As DataRow In dataSource cmd.Parameters.AddWith b7e8fdf5c8
