
.NET Reflector

.NET Reflector is a stand-alone tool that allows you to analyze DLL and EXE files and even Microsoft Visual Studio solutions from any location. Being a decompiler, it can get your code back from just about any obfuscated or difficult-

to-reverse obfuscated code. When you decompile any.NET assembly, you can understand how all the core libraries, such as Windows Forms controls, as well as the Web frameworks and components work. .NET Reflector is a useful component that enables you to monitor

your applications and extract their code at any time. Thanks to that, you will be able to patch code, understand unknown API usage and even debug the source code. You are free to use breakpoints, trace the program's execution and track down application crashes.

You have the option to decompile .NET assemblies into C# or VB.NET language because .NET Reflector supports both. The tool also works as an IDE plugin, so it can be attached to Visual Studio and be used as any other integrated component. Additional features allow you to

restore XML
documentation of
components, see the
source code of
components, manage
the namespaces using
XML comments, look at
the list of loaded
assemblies, determine
if a file was compiled
or signed. .NET

How to clear
autocomplete search
field from variable
memory I have custom
autocomplete search
field, which I get by
calling `getSelect()`
function from jquery-ui
1.8.10. When the user

selects an item from the result list, I add selected item as a new selected object to global variable, which contains all selected items. When the user selects another item I want to clear all previous selected items. Here is the code: `var selectedItems = [];` `var`

```
selectedItemsTemp =  
$('#selection_input').se  
lectmenu('getSelect');  
$('#selection_input').v  
al(''); selectedItems =  
selectedItemsTemp;
```

But as you see, this code will empty both global variable and input box, which makes no sense to me.

A: This code is working fine, but it's because of

the `selectedItemsTemp` var was created to be a reference to `selectedItems` which you want to clear. If you want to store the value

What's New in the .NET Reflector?

.NET Reflector is a comprehensive and practical piece of software especially designed for

developers who need to decompile and fix.NET code, as well as debug libraries, components, and frameworks. Using this program you are able to save time and simplify development by debugging into the.NET source that you currently work with. This way, you can

follow bugs, third-party components and any compiled code effortlessly. Also,.NET Reflector allows you to check that the right version of your component is presented and make sure that the obfuscation is effective. You can look inside DLLs and *.exe

files with ease, thus understanding how apps were designed and starting to reconstruct the missing or corrupted code. The main window enables you to open as many DLL files as you want and decompile or analyze them instantly. You can find out whether bugs are in

your code or in third-party apps, attach breakpoints, and debug live in order to view how your program behaves in real time. Since .NET Reflector also works as a Visual Studio plugin, you are able to use these debugging techniques on any assembly, so the source code is

always available for your libraries. On this matter, you can understand how APIs, frameworks, components and all the critical code you use really works. Another important feature that makes the application stand out is that it supports C# and .NET 1.0, .NET 2.0 and

even.NET 4.0, so you can easily decompile the assemblies and replace poor or missing documentation, regardless of the source file.

Overall,.NET Reflector proves to be a steady and reliable solution when it comes to creating better controls and WebParts, tracking
