StarUML is an open source project to develop fast, flexible, extensible, featureful, and. of software license that has been certified to meet the criteria of the Open. UML) to represent the structure of the code or.Loss of Differentiation In normal development, cells in one part of the body (or organ) are derived from the cells that produced them in another part (or organ). This developmental process is called differentiation. Normal differentiation is required to create organs and the cells that make up tissues. Loss of differentiation results when the cells in one part of the body (or organ) produce the cells that produced them in another part (or organ). A loss of differentiation, such as in cancer cells, is called dedifferentiation. Differentiation Normal differentiation begins with an undifferentiated cell. This is a cell that is specialized to its niche in the body. Differentiation begins with stem cells. As a stem cell produces progenitors, the daughter cells start losing their ability to reproduce themselves. Eventually, the daughter cells become specialized to a particular type of cell and no longer can replicate themselves. In time, these cells differentiate to make up an organ. In humans, tissues are specialized to perform a particular function. For example, the lung makes gas and acid to help the body's cells move the oxygen and carbon dioxide in the air. Stem cells can get stuck One thing that limits the number of different cell types in an organ is the number of stem cells. These stem cells have two jobs. First, they make cells that give them daughters that then have two jobs. Second, they make other stem cells. The stem cells that make other stem cells become fewer and fewer as they get old. Eventually, they do not reproduce. This situation is illustrated in the figure below, which shows a stem cell as the circle with the "+" sign. As the stem cell makes daughter cells, they become smaller circles with a smaller "+" sign. The stem cell can make more daughter cells, but fewer and fewer of the daughter cells make daughters. The stem cell reaches its absolute limit. The stem cell has no other job than to make daughter cells. Unhealthy stem cells There are several types of stem cells. You may have heard of embryonic stem cells, which are stem cells found in early embryos. They can replicate themselves. They are
