The development of CAD has been closely tied to the growth of the computer industry. Since the 1970s, advances in computer technology, and the changing needs of design and architecture, have made CAD software more and more user-friendly. CAD has progressed from a relatively primitive set of tools, capable only of drafting straight lines, to sophisticated computer-aided design tools. The rise in popularity of these tools in the 1980s has created a need for more advanced techniques and better design software. As computer prices have declined and graphics capabilities have improved, CAD software has become more and more affordable and popular. The principal design tools are orthographic, isometric, and perspective views. Orthographic views are views that show the object as it would appear to a viewer at the given distance and angle. The most common orthographic views are: Isometric views are the same as orthographic views, but they are displayed on a two-dimensional surface. In this view, planar objects are displayed as though they are seen from above or below. A common isometric view is called a hatch-overview. A perspective view is a 3-D view that appears to be taken from a certain distance. This 3-D view gives the illusion of depth, as objects closer to the viewer appear smaller, while objects farther away appear larger. Because of the apparent depth, perspective views are usually used to plan and design buildings. Some of the more important views that CAD programs make available are: Bird's eye or top-down view is a two-dimensional view that allows a user to see all of an object at once. Site plan is a two-dimensional view that allows a user to see the overall layout of a site or building. Axonometric is a two-dimensional view that allows a user to view an object from different angles, and that may be rotated. Editor views are additional views that are used to view a drawing or document. The most common of these are: Sketch view: This view is used to create a simple drawing, which can be used as a presentation, record of an idea, or design guide. Draft view: This view is used to draw straight lines. It is often used to draft a building or road pattern. Block view: This view is used to place 2D objects (for example, a wall) into a 3D model. Drafting views are the most basic views that Auto

Data interchange formats From the beginning of AutoCAD Crack Keygen, the main data interchange format was its own proprietary format, called BIL, which is binary line art. A new format was introduced with Autodesk Architectural Desktop when that product was introduced in 1988. This was a vector-based format called ACIS, in which it was thought that the toolbars and menus would be transferred directly. However, this turned out to be much more difficult than expected, and there was a lot of reworking to convert ACIS into DXF. In 1992, a group was assigned to develop the DXF format. The DXF file format was introduced in AutoCAD in 1994 and was the first non-BIL file format to replace BIL. It is the current standard for CAD data interchange, as all new products use DXF as an internal format. Recently, AutoCAD introduced DWG as the CAD file format to share with other CAD applications and file transfer, see DWG interchange. Project types and drawing sets AutoCAD supports the following project types and drawing sets: AutoCAD DWG project with a default Master Part that is the Main drawing, as well as other parts such as Equipment lists, etc. AutoCAD DXF project with a default Master Part that is the Main drawing, as well as other parts such as Equipment lists, etc. AutoCAD DWG project with multiple Parts, each part being a separate drawing In each of these cases, there is a single Master Part that has associated many Pieces in the drawing. By default, when a drawing is opened, a new Piece is automatically added to the Part belonging to the current drawing. Changes to one of the drawings Part can be synchronized to other drawings Parts with the Update Piece command. The following types of Parts are associated with the default Part of the Main drawing, unless specified otherwise: Fittings: Parts with standard connections such as holes or bolts Features: Parts representing distinct geometric features Gradations: Parts representing a change of color (or an area change) over an object Layers: Parts representing specific layers Blocks: Parts representing a grouping of solids, surfaces, and other geometric objects Symbols: Parts containing color, line style, line type, or dimensions Palettes: Parts with text styles, fonts, and other text properties af5dca3d97
