Do I understand correctly that after every successful build database will be dropped? Does SQL Server only notice that meven is triggered? Is it good idea to force meven to not drop database, so that after build, if database was created, it will be dropped only if build failed? A: Does MEVN in TeamCity trigger the drop of SQL Server database? Yes, it does. You need to consider TeamCity as a build automation software and should be used in a continuous integration fashion. There are SQL agents built-in to TeamCity that run regularly. Those agents are used to perform T-SQL statements to do actions like, update the build's database with application data, etc. The SQL agent in TeamCity is local to each build and not database dependent. So, it can drop a

database. Do I understand correctly that after every successful build database will be dropped? Yes, you understand correctly.

TeamCity may have other scenarios and options to do things like, trigger Agent, etc. So I am not exactly sure what you mean, but I assume you are familiar with TeamCity and using it correctly. Is it good idea to force meven to not drop database, so that after build, if database was created, it will be dropped only if build failed? That is not really required. You can configure TeamCity with different configurations that do different things. So, I am not exactly sure what you are asking.

A: I'm going to make a correction to what another user has already said. SQL Server does not use any internal timer to detect a network downtime. It will only notice the loss of communication via a local SQL agent. To the best of my knowledge, the only way to make TeamCity control the drop of the DB is to either use a manual trigger, or set the database to always check for triggers. Q:

Testing the evidence on the economic effect of an at-risk population on chronic disease prevalence: the example of overweight and obesity. The effect of an at-risk population on the prevalence of a chronic disease is usually assumed to be substantial. A detailed analysis of the empirical evidence is, however, lacking. This study examines the evidence on the effect of an at-risk population on an outcome

of chronic disease using the example of obesity and overweight in the Netherlands. Based on national cross-sectional data between 2004 and 2007, combined risk factor modeling was performed to examine the relationship between an at-risk population defined by overweight and obesity and the occurrence of overweight and obesity in this population.

The proportion of overweight and obese adults, with and without diabetes, was positively associated with the at-risk population. The strength of the association was stronger when the at-risk population was defined by obesity, as compared to overweight. The study concludes that the evidence in favor of an at-risk population is limited when overweight and obesity are used as the outcome of interest, whereas the effect on the prevalence of diabetes is more robust. The lack of quantitative evidence on the effect of an at-risk population can partly be explained by the apparent dilemma of a diverging effect on at-risk and not-at-risk population. In the absence of quantifiable evidence, it is advisable to rely on intermediate outcomes for a more robust measure of the effect of an at-risk population.--TEST-- Test mkdir() function: usage variations - dir & subdir with more than one character --CREDITS-- Dave Kelsey --FILE-- 6d1f23a050
