Stop by after work or make a date night with Tuesday night trivia, weekend.. Easyworship 2009 Build 19 Keygen84Q: R: Convert multiple numeric columns into single column I have a df which has several columns of numeric values. I would like to have it with only one column of values representing the mean of all the numeric values. Could you please tell me how to code that? A: Assuming that there is a column named mean which contains the mean of the numeric columns, then you can use the aggregate function for that: `aggregate(mean~1, data = df, FUN = mean)` If there are several columns which contain numeric values, then we
