Your email address is
safe. I'm a data
collector and even
when you reply, your
email address will not
be given out to any 3rd
parties. Q: Why is
Python DataRobot tool
giving different results

for my CSV file? I am trying to use the DataRobot tool for the first time, and I have successfully queried my database. However, my query is giving me different results from the tool than when I run it on the database manually. Is there something I'm doing wrong? Is there something wrong with my CSV? I have also tried to run the same query and then convert the CSV to a more

table like structure.

That did not work either. Here is my CSV File: `firstname,lastname,age`
`leon,smith,20`
`tim,brown,30`
`stacie,york,10` And

here are the first few lines of the output:

```
Requested_Outcomes {  
  "fieldname": "allergen_exposure_history.first_name",  
  "fieldvalue": "leon"  
}, {"fieldname": "allergen_exposure_history.last_name",  
  "fieldvalue": "smith"}, {"fieldname": "allergen_exposure_hist
```

ory.age", "fieldvalue": "20"} When I run this on the database using the DataRobot tool it is giving me the following: allergen_exposure_history.first_name leon allergen_exposure_history.last_name smith allergen_exposure_history.age 20 This is how I am defining my query: Operand Type: List (select) Operator: IN Field(s): Data Source(s): Input: Input from Database: Output to Database: query_1

= Database.query(Database.INNERJOIN, 'allergen_exposure_history, allergies') Query is returned as a Table object. Thank you so much for your help! A: I'm not familiar with data robot but if you want to run c6a93da74d
