one of the downsides of goodsync, and one of the reasons i have not recommended it for your enterprise, is that goodsync is not optimized for use in the enterprise. it lacks the advanced features needed to implement a server, which has been added in the resilio connect. however, goodsync is a solid one-way file sync solution. goodsync is easy to use and can be setup and managed without a dedicated it administrator. goodsync is a good solution for personal and small business usage. as stated above, goodsync is also limited by its use of direct ip addresses. goodsync discovers other machines on the lan using network broadcasts. resilio connect uses a smarter approach combining multicast and a tracker server. the client registers on the tracker server and the tracker server announces the ip addresses of the other machines to all computers within a job. this way you can avoid job changes if machine ip addresses are changed and can set up a direct connection between machines over the internet without any configuration. a goodsync backup is performed by transferring selected files from the destination to the source. the goodsync backup can be set up to run automatically or manually. this is called a manual backup, because the backup can be initiated manually by the user. it can

also be set up to run automatically after a time interval, or at a specific time, which is called an automatic backup. the file size and the maximum number of files that can be backed up can be configured. goodsync provides a number of options to modify the way the backup process is performed.

GoodSync Pro 10.6.1.7

goodsync uses files in the following format: { id: uuid, filename: utf8_encode }. goodsync allows for two types of payload. you can set the size of the payload, and you can set the type of payload. the type of payload determines how the data will be transferred. goodsync has two types of payloads: unsynchronized wishlist we used the goodsync desktop client for windows and mac to perform backups and share files. it is a good application, but the upload speed is very slow. it can take several minutes to upload a small file. if you are transferring large files, this can increase the backup time to hours. during the trial period, goodsync automatically uploaded our backups to the goodsync cloud storage service. during the trial period, we had to manually select the files that we wanted to share. after paying for the service, we still had to manually select the files we wanted to share. this meant that we werent able to automate backups and sharing. we have since switched to the goodsync cloud-based solution. goodsync can upload your files and share them with you or other users, but it does require that you have a goodsync account. the unsynchronized payload is a
