## Realflight G5 Dongle Emulator 34

I have several Silverlight projects at the moment and for some reason I couldn't get debugging to work on one but all worked just... I tried setting breakpoints in the debugger, setting breakpoints at point breakpoint I set and just clicked the "Run" button, but I don't have any success. I've looked at various resources and it looks like people are trying to do something similar but they have debug windows that just show what's going on but I can't see them. Any ideas? Thanks I ran into the same issue when trying to do this. I found a solution, but it's a bit tricky.
