
Sap Bw 74 Practical Guide Pdf 253 !!TOP!!

this guide is intended to assist clinicians in the diagnosis, classification, and management of itp. the level of evidence, grade of recommendation, and strength of the recommendations reflects the best available evidence. the strength of a recommendation should not be used to predict the outcome of an intervention. 166-168 evidence is available to support age and sex related differences in platelet counts in the evaluation of itp. as in childhood itp, we found insufficient evidence to make a recommendation or suggest the measurement of platelet parameters on a panel analyzer, without evidence of benefit in predicting response to therapy in adult itp and pediatric and secondary itp. many agents can produce ototoxic effects. the capacity of each one to damage the inner ear depends on a number of factors, among them, the concentration and duration of exposure. some of the most significant ototoxic agents include the heavy metals arsenic, mercury, and lead. another is paraquat, an herbicide found in a variety of products, including weed-killing products (such as roundup). exposure to paraquat can occur through the respiratory system as an aerosol, through skin contact, or through oral ingestion. paraquat is readily absorbed through the skin, and excessive contact can lead to severe pulmonary disease. a common cause of workers' compensation claims for hearing loss is occupational exposure to hazardous occupational noise. there are various methods of exposure assessment, including auditory testing, use of audiometry, and more advanced means of measuring exposures, such as dose-frequency-response relationships and transfer factors. 15-19 for each of these methods of exposure assessment, specialists and audiologists must understand not only the accuracy, reliability, and validity of the approach but also the limitations of the method under conditions of actual practice.
