
Livesuit Pack V1 .05.zip

Download

If after a few minutes, the LiveSuit app says the update failed, this may mean that the hardware is not connected correctly and may need to be reconnected and rebooted. Alternatively, the firmware update may have failed due to a lack of free space on the microSD card. To fix this, you'll need to remove the firmware files from the MicroSD card that were installed by the firmware update and put them back in the original USB drive. To do this, disconnect the PIPO P1 from the computer, plug it into the USB cable, eject the USB drive and then reinsert the USB drive (if your USB drive is not on the computer or if it has been disconnected in the meantime, the PIPO P1 will be immediately available on the list of available USB drives). Now extract the upgrade.zip file and launch the Livesuit upgrade tool, this tool will take care of the installation and configuration issues, just follow the instructions as the first time you try it. All you need to do in the software is press next, make sure you have all your details correct and the order is correct and when you press start it will flash the livesuit system to your tablet. and when it is done, it will say done. The rest of the components are fairly similar to those found in previous packs. More than that, theres the ODROID C1X, ethernet jack, USB-C power cable, USB-C OTG, the battery, the 3.7v Mini USB, a nice looking aluminum case and more. As I said before, theres a bunch of extra stuff. When I finally got it all setup and started flashing the Firmware, the process went really smooth. In just a few seconds, the update was done and the device was ready for use. In case you are wondering what this means, you can now go ahead and try out the LiveSuit smartwatch.

Livesuit Pack V1 .05.zip

All you need is a Windows computer with the LiveSuit application installed. This is free to download on the LiveSuit website or on the Android and iOS app store. Once downloaded and opened, you will be asked to configure the Bluetooth profile that your device needs to be paired with. Following that, you are prompted to pair the device via the Bluetooth icon in the toolbar. This part took me a while

to figure out, because the Windows Bluetooth icon is found in different places and is in many languages. When it looked like it was about to pair with the ODROID, I kept hitting the wrong buttons and accidentally turned off the connection. When it comes to functionality, the LiveSuit smartwatch is fully usable. The gestures are pretty much the same as before. You can simply swipe from side to side or downward on the screen to go to the next page, and swipe upward to go back. The widgets are also pretty much the same. You will find the same weather forecast, news, social media, toggle wearables and just about everything that you are accustomed to seeing. There are a few limitations to the LiveSuit smartwatch. At the moment, you can only download the Livesuit Smartwatch W/ODROID-C1X firmware for the ODROID-C1X. There is also a way to upgrade the Firmware to Firmware v.2. The problem with that is that the application is quite glitchy. A lot of times the Home screen disappears when I load it and when I click on the actual LiveSuit application, the screen will go white or completely empty. This is the case in all other videos I have seen, so I decided to just keep with the first firmware available to me until I get a working upgrade. 5ec8ef588b
