It's time to talk about Semi Automatic. Unfortunately, this new setting does nothing to help when editing images, but it does have a case for "Save Paper" for new images. A new "Save Copy for Paper" feature puts the current image into the background. A Save Copy Comes Later dialog will then appear to let the user decide what to do with an image that has been framed; it can be saved to the desktop as a JPEG, saved to the XMP sidecar as a PSD, or even moved to the desktop, along with the Save Copy comes later dialog. That's it, just one more way to save paper, which is something that will always come in handy in a cutthroat world such as this one. An exciting new feature is the ability to add text objects to a specific layer. The new text box is a full-screen—that is, it's a real-time component of the interface—and its behavior is still very cool in Photoshop's latest version. Yet again, Adobe has proven that it's not afraid to take a bit of design inspiration from other programs and package it into Photoshop. Fonts are always an important design component to any software, and with this new style of Text layer, it's now possible to change the font size, color, and so forth, a much faster way than before. In fact, this new feature emulates the built-in Text tool (with one important exception in that it's a separate layer rather than a pre-existing feature). With the addition of the Text layer, Photoshop is now my absolute workflow program of choice, especially when it comes to adding and editing text, of course.

Not only is the Photoshop interface relatively complex in terms of tools, methods of operation, and layers, but Photoshop's feature set is also vast. There is a large asset library of proprietary plug-ins for Photoshop that make working on images within Photoshop much easier. These plug-ins can also offer opportunities for workflow automation and accessibility of state-of-the-art technology. For example, the ability to quickly search for a particular filter, crop tool, or adjustment type is one of the main strengths of Photoshop that will be available in web app. The browser-based image editor will also be a one-stop shop for sharing photos with the world. While there are plenty of photo editing features that are native to Photoshop that do not make the jump to the web app, there are some great new additions as well. The in-app camera has a range of new features based around the RED RAW Camera Sensor, which provides 4K and Full HD video recording at up to 7k resolution, equal to the filesize of 4K photography. Photoshop will also natively export both 4K and Full HD video for online sharing that will look great on desktop or mobile devices. Video editing tools will also be included, including the ability to add overlays to footage. The functionality of the new web app will ultimately depend on which older native Photoshop tools work correctly within the HTML5 canvas, but some of the image editing features that are included with the latest release will certainly be valuable to creative professionals.
