Great article. I'm already using Elements and Lightroom, but this review has made me aware of some of the things that it doesn't do that Photoshop does, and perhaps I will make the jump. Thanks! Hey Ryan, Sounds interesting. But what exactly are you going to be doing that you need the UIs. Creating fine art and canvas images requires a lot more digital painting than what you find in Elements. I mean, Elements is great for that but I think it is aimed towards the do it all types. I love the software and keep it installed on multiple systems (PCs, my iPad and my MacBook Air). I use it to edit images on an almost daily basis, and I always try to automate the process, since I hate searching for images on multiple computers. This automation begins with Lightroom, since it's the best ICT convertor, but it has become a no-brainer to batch-import via the Darkroom extension, whether the images are saved as JPEG or RAW. The application is a long way off being as flexible as it should be. For example, when you save an image as a Web Link, you can not immediately open it on your computer. You receive a plain vanilla JPEG file. You have to activate the link, and then download the RAW version to your computer. Once you open the RAW version, you might discover that original images don't export properly, because it turns out that those are DCRAW base layers not.cr2. The noise reduction has always been a favorite of mine. It's crude, it has a tendency to produce artifacts, and it doesn't seem to know the difference between noise and detail. The Noise Ninja only add some blurring to make things look a bit more natural, but then it doesn't really know which part of an image represents noise, detail, or an object.
