- Shows the current title, artist, album, and artwork (if available) of the current played song - The current song will be played by double clicking on it - Includes buttons to show the current time, previous, play/pause, and next - Play or Pause button activates the playback control from the main window - Will update automatically, if you exit iTunes and re-open Hi there! This is my first post on this forum. I have one problem: The iTunes Controller Cracked Accounts side bar gadget that shows the current music when you play a song is not updating with the currently played song. It updates the previous song when you double click on a song. But it does not update the currently played song. I've tried updating with a refresh/reopen, I've reinstalled the program,... I have also checked the update checkbox and the system clock has been set to show the correct time. Update: I did some research and found a solution: It works, if I just drag the gadget to the dock. But it doesn't show the current song. If I use the mouse, the gadget sometimes doesn't update at all, sometimes it works once, sometimes it works twice, sometimes I have to do it ten times. I have version 1.5. -- Thanks for your help! "There is nothing more difficult to take in hand, more perilous to conduct, or more uncertain in its success, than to take the lead in the introduction of a new order of things." - Niccolò Machiavelli I cannot update the status on my GS7. For some reason, the status update will not work in the sidebar. I have checked the settings and they are correct. When I open the "Master Control" the sidebar shows the correct title, artist, album, cover, etc. But the status does not update. It is not the "double-click" but the "updating of the widget" that is slow, and not always. It could be that I have to update this gadget more often. If you have another idea, it is welcome. Edit: A side note: I just tried it with the new "Remote Control". The widget is updated, but there is no "Play" button, and no indication how long the song is. I cannot update the status on my GS7

Rethinking the RNAi revolution: RNAi, microRNAs and the body. Recent discoveries of endogenous noncoding RNAs are expanding our perspective on gene regulation and raising new questions about the function of the RNAi pathway in development. Here we show that RNA interference is active in embryos of the cnidarian *Nematostella vectensis*, a basal metazoan with a unique, bilaterally symmetrical body plan. We detected the core RNAi machinery and the histone deacetylase HDAC3 in these animals. Although the microRNAs are widespread in the *Nematostella* genome, their expression patterns are limited to the germ line, suggesting a narrow function. We propose that ancestral RNAi genes initially encoded signal transduction molecules. This hypothesis unites various aspects of the RNAi story, including signal transduction, regulation of gene expression and the generation of somatic cell differentiation.

Multi-objective decision-making in the prokaryotic cell cycle: cell-fate choice in *Escherichia coli*. Our understanding of the mechanisms underlying decision-making and the factors that influence cell-fate choice remains rudimentary. The bacterial cell cycle offers an excellent model system in which to study these issues. One of the most prominent mechanisms governing the cell cycle is the decision by cells to commit to DNA replication or to begin the next round of chromosome replication in the form of a new cell division. In the case of *Escherichia coli*, the decision to proceed with division involves one of three checkpoint-dependent modes of cell division: the chromosome replication checkpoint (CHRC) is responsible for coupling cell division to completion of chromosome replication, whereas the DNA replication checkpoint (DRC) delays the initiation of the new round of chromosome replication. The sequential activation of the DRC and the CHRC is controlled by the DnaA initiator protein, whose availability for initiation of DNA replication increases as cell division progresses.

On a recent project, we were asked to measure and track customer engagement for a certain set of customers. Given the importance of this set of customers, we felt that we should take the time to develop an interface that we could use to measure engagement for all of our customers, whether it was for a sales call, a quote, or even a survey. We created an interface that measured overall engagement. We created an interface that measured response rate. We created an interface that measured each of the stages of a call. And then we created an interface that could be used for each of those stages of a call, with a click of a button. Now, before we go into the details, let's first outline the key points that we needed to implement in this interface: This application needed to be highly visible on a Mac. This application needed to connect to an already existing database. This application needed to be searchable. All of the employees involved needed to have the ability to see the data. From a technical standpoint, we needed a way to allow the application to be mobile, meaning that it was able to connect to our cloud-based database to save the data. From a technical standpoint, we needed to provide a way for the employees to create, edit, and delete any of the data. And finally, we needed to be able to export the data to an Excel file or to a CSV file. Now, that was quite a lot to take on and for our team, we didn't have a lot of time. We weren't interested in going through the hassle of buying an application or asking someone else to develop this interface for us. That would be quite a time-consuming process, and time was of
