I believe you can't use Photoshop much without a good understanding of what you are doing. The interface is complex and most people often end up stuck in a deep level of complexity. The more advanced features require some experience and are not meant for beginners. While the same can be said about a lot of other software, Photoshop is quite unique in its complexity. In the end, it's probably the best multi-user software available. I warn you, though, Photoshop is not for everyone and you must be quite proficient in a lot of things if you want to truly utilize it. The new adaption of Smart Sharpen, though impressive, is a slightly slower tool than the previous one. You have access to two different Smart Sharpen styles for users of Lightroom, including the default, "Smart Sharpen automatically detects edge information, lens distortion, and radial noise levels." Other styles available are "Classic Sharpen," and "Sharpen for Exposure & Recovery." There's also the option to "Sharpen with an Enlarged Detail," which provides additional isolation on sharpened edges. If you truly want to try out Photoshop in its full power, Apple's Dylan Paul demonstrates what you can get out of Photoshop and what you can't quite get out of it, given its XML-based limitations. I suspect that, to some degree, what you can and can't do is simply a matter of having a big enough machine. Adobe's Synthcam feature is now a stand-alone app from the Fireworks line. The new software offers a preview layer, cropping, and adjustment tools, all of which you can apply to a source photo and also to edited photos. The preview layer has vanishing points to guide you in positioning objects in a layer. Synthcam also has some interesting editing functions, including Noise Removal, Black & White Adjustments, Lens Distortion Adjustment, and High-Key Adjustment. Sure, you can already do that in the filters in Photoshop, but Synthcam has an automatic exposure setting that really makes it stand out. Further, Synthcam can be used in the browser. For example, you can freely browse to a website and adjust it in Photoshop CC and save it that way. Synthcam can even be embedded in your own website. Just keep in mind that this newly created image won't use the same font size and other CSS format as a website. I'm sure Adobe wants to have people create such images and websites.
