"I'm between songs, but one time I got together with. I am having a 100th birthday party for my husband next month. I am going to present a song with this version of SONG OF CROESONG" - Linda M. Phoenix, AZQ: What to do with multiple tables required for access I have a database that I would like to check to see if the data is invalid. It will take care of the default values (gender, birth date, etc) and would take the values provided by the user. I have 3 tables: Customer, Purchase, and Specification. A Customer is associated with one Purchase, and one Specification. The table (Purchase) just contains the following columns: Id CustomerId Date Value The table (Specification) contains some boolean values (1,0) and another column: Id Specification Value The table (Customer) contains an example of what I would like to update, as well as the foreign keys to the other tables CustomerId Gender BirthDate I am attempting to use this query to determine if the data is valid or not. update customer set c_gender = @c_gender, c_birthdate = @c_birthdate where c_id = @c_id The problem is it requires columns from 3 tables, which seems redundant. Should I make all three of the tables user-editable and have a list of which one to use for each column? Should I just have a single table that holds the default values and then a second table of data? A: If your customer can be null, you should have a customer table which has a nullable foreign key to Purchase. So Customer has CustomerId and CustomerId is the primary key of Customer and can be null. Specification has Specification and SpecificationId and SpecificationId is the primary key of Specification. Then Purchase has PurchaseId and PurchaseId is the primary key of Purchase. Purchase may also be nullable. This would allow you to set the customer in the database when a customer is null. The specification table is there if you want to restrict what may be used or be defined in the specification and the specification id in purchase may not be a valid id for a specification. Once the customer
