Deer Hunter 2005 Free Download PcTwo sides of the same coin: The surgical approaches to the supratentorial and spinal meningiomas. In this article, the authors analyse the surgical approach and the surgical outcomes, in a comprehensive view, of meningiomas. Their aim is to review the effectiveness of the surgical strategies for spinal and supratentorial meningiomas, which are always two sides of the same coin. We performed a systematic review using the following MEDLINE PubMed(®) databases for the period of January 1, 2000-December 31, 2014, to retrieve all clinical articles reporting surgical approaches and the outcomes of spinal and supratentorial meningiomas. The following search terms were used: "meningioma", "spinal", "supratentorial", "ramifications", "microsurgery", "open surgery", "conserving surgery", "complete resection", "clinical results", "complications", "quality of life", "treatment options". After the screening of 445 articles, the authors selected all the clinical articles written in English in the last 10 years reporting the surgical outcomes of spinal and supratentorial meningiomas. The two surgical approaches and the two tactics have the same endpoint: The aggressive treatment of the disease to be able to improve the survival and the quality of life, but also to reduce the risks for complications and recurrences. The radiological classification seems to be an important factor for the choice of the surgical approach. For spinal meningiomas, posterior laminectomy and complete posterior spinal fusion in staged procedures are the most used approaches. For the supratentorial meningiomas, anterior and lateral approaches are the usual surgical tactics. Classification of muscarinic ligands at M4 mAChR by homology modeling and molecular docking. M4 mAChR is an important central acetylcholine (ACh) receptor (mAChR) subtype involved in cognitive and behavioral function, and has been shown to regulate the release of glutamate in the hippocampus. Hence, the development of selective M4 mAChR agonists and antagonists has been a research focus in the pharmaceutical industry. In this study, a homology model of the M4 mAChR was built using a two-step homology modeling method, and the top 10 agonists and antagonists of the muscarinic acetylcholine receptor M2 mAChR were docked
