The iPad Pro display is gorgeous, the Pencil is surprisingly easy to learn to use, and it's ready for real game-changing creativity. We've never been more excited about a Mac or PC. A nice surprise is that this is first use of an iPad Pro with the Pencil. When it comes to presenting creative projects — photos, web designs, illustrations and, even graphics for printed magazine covers — Photoshop will always have a major part in that game. Flash is a big part of that world of job. The iPad Pro and its Pencil are a big part of that world of job. No new capabilities are required for any of Photoshop's basic workflow tools. The stylus is excellent on paper, and it works with the existing tools effortlessly. But that's about all it can do. Photoshop's real strength lies in its capabilities for managing large image files. The Photoshop installer is huge, consistent with the tool's elite status. Over time, I've come to expect the worst from celebrities. It's hard to get even the most respected to chip in on reviews. (Although some staunchly independent reviewers like Apple's Pascal Johann and Scott Bensen have been contributing to PCMag for almost 15 years.) "If you use a computer, a tablet, or an iPhone at work, I think you already use Photoshop. We updated Photoshop to work great with the iPad Pro and Apple Pencil, letting you work more freely without sacrificing quality," says Adobe's Taylor Renfro. What makes this experience difficult is that the options and procedures we've been taught our whole careers are fundamentally incompatible with the new tools. (The same is true of the Mac platform in general, but that's a topic for another day.) The iPad Pro and Apple Pencil simply don't fit into the way we've been taught to use photo editing software.

I recently was approached by a client who wanted to create a special effect in Photoshop. He wanted the image to be completely transparent and he wanted to create a red strip in the middle of the image. Photoshop has many layers and textures, which can be very useful when creating special effects. His goal was to create a new layer and place it on top of a layer with a transparent background. Then he wanted to color the strip red. Finally, he wanted to give the image a drop shadow effect. The client requested all of this to be done in just one layer. With Photoshop you can use the layers and modify each layer separately. This is a great way to create special effects because you can edit each layer individually. e3d0a04c9c
